

Salt and the Weight of the World

Materials:

- Clear or translucent pitcher
- 5 cups hot tap water
- 1 uncooked egg
- 1/3 cup of table salt
- Spoon

1. Pour hot water into the pitcher.
2. Gently set the egg in the water
3. Add a little salt at a time until all salt is poured in
4. Stir water and salt mixture carefully, so the egg doesn't break

*After all the water and salt are stirred, the egg won't be able to stay down. With the dissolved salt, the density of the water has changed. The egg is less dense than its surroundings, so it floats!

Through this activity we see that even with the weight of the world pressing down on us, we can be lifted. With God, all things are possible.
